# 1 Complete Orbital Structure of Magic Numbers

This section reveals the fundamental pattern: each major shell closure is built from **decreasing sequences** of orbital capacities, always ending at 2, then starting a new sequence with increased capacity.

## 1.1 The Decreasing Sequence Pattern

**MAGIC NUMBER 2:**

- Simple:  $s_{1/2}(2)$
- **Sequence: 2**

**MAGIC NUMBER 8:**

- Sequence 1:  $p_{3/2}(4) \rightarrow p_{1/2}(2)$
- **Decreasing:  $4 \rightarrow 2$**
- Plus previous: 2
- Total:  $2 + 6 = 8$

**MAGIC NUMBER 20:**

- Sequence 2:  $d_{5/2}(6) \rightarrow d_{3/2}(4) \rightarrow s_{1/2}(2)$
- **Decreasing:  $6 \rightarrow 4 \rightarrow 2$**
- Plus previous: 8
- Total:  $8 + 12 = 20$

**MAGIC NUMBER 28:**

- Sphere closure:  $f_{7/2}(8)$  — *single high-j orbital*
- **New sequence starts: 8**
- Plus previous: 20
- Total:  $20 + 8 = 28$

**MAGIC NUMBER 50:**

- Sequence 3:  $f_{5/2}(6) \rightarrow p_{3/2}(4) \rightarrow p_{1/2}(2)$
- **Decreasing:  $6 \rightarrow 4 \rightarrow 2$**
- Plus sphere:  $g_{9/2}(10)$  — *starts new sequence*
- Plus previous: 28
- Total:  $28 + (6+4+2) + 10 = 50$

**MAGIC NUMBER 82:**

- Sequence 4:  $g_{7/2}(8) \rightarrow d_{5/2}(6) \rightarrow d_{3/2}(4) \rightarrow s_{1/2}(2)$
- **Decreasing:  $8 \rightarrow 6 \rightarrow 4 \rightarrow 2$**
- Plus sphere:  $h_{11/2}(12)$  — *starts new sequence*
- Plus previous: 50
- Total:  $50 + (8+6+4+2) + 12 = 82$

#### MAGIC NUMBER 126:

- Sequence 5:  $h_{9/2}(10) \rightarrow f_{7/2}(8) \rightarrow f_{5/2}(6) \rightarrow p_{3/2}(4) \rightarrow p_{1/2}(2)$
- **Decreasing:  $10 \rightarrow 8 \rightarrow 6 \rightarrow 4 \rightarrow 2$**
- Plus sphere:  $i_{13/2}(14)$  — *starts new sequence*
- Orbital types: h, f, f, p, p, i
- Plus previous: 82
- Total:  $82 + (10+8+6+4+2) + 14 = 126$

#### MAGIC NUMBER 184 (Predicted):

- Sequence 6:  $i_{11/2}(12) \rightarrow g_{9/2}(10) \rightarrow g_{7/2}(8) \rightarrow d_{5/2}(6) \rightarrow d_{3/2}(4) \rightarrow s_{1/2}(2)$
- **Decreasing:  $12 \rightarrow 10 \rightarrow 8 \rightarrow 6 \rightarrow 4 \rightarrow 2$**
- Plus sphere:  $j_{15/2}(16)$  — *new sequence*
- Plus previous: 126
- Total:  $126 + (12+10+8+6+4+2) + 16 = 184$

## 1.2 The Universal Pattern

Table 1: Decreasing sequence pattern for all magic numbers

Magic	Decreasing Sequence	Sphere Starter
2	—	2 (s)
8	4→2	—
20	6→4→2	—
28	—	8 (f)
50	6→4→2	10 (g)
82	8→6→4→2	12 (h)
126	10→8→6→4→2	14 (i)
184	12→10→8→6→4→2	16 (j)

#### Key Observations:

1. Every sequence **decreases by 2** at each step

2. Every sequence **ends at 2**
3. After closing at 2, a **new sphere-forming orbital** initiates the next sequence
4. The sphere-forming orbital capacity increases:  $2 \rightarrow 4 \rightarrow 6 \rightarrow 8 \rightarrow 10 \rightarrow 12 \rightarrow 14 \rightarrow 16 \dots$
5. This creates the recursive pattern: **start higher, descend to 2, start even higher**

### 1.3 Visual Representation

Magic 8: [4→2]  
 Magic 20: [6→4→2]  
 Magic 28: [8] ← sphere closure  
 Magic 50: [6→4→2] + [10]  
 Magic 82: [8→6→4→2] + [12]  
 Magic 126: [10→8→6→4→2] + [14]  
 Magic 184: [12→10→8→6→4→2] + [16]

This is **exactly** what the phenomenological formula  $\Delta n = \frac{c_{start} \times (c_{start} + 2)}{4}$  captures: the sum of a decreasing even-number sequence!

### 1.4 Orbital Angular Momentum Pattern

The progression of highest- $j$  orbitals reveals a systematic pattern:

- **Magic 28:** Closes with  $1f_{7/2}$  ( $l = 3$ , capacity = 8)
- **Magic 50:** Highest- $j$  is  $1g_{9/2}$  ( $l = 4$ , capacity = 10)
- **Magic 82:** Highest- $j$  is  $1h_{11/2}$  ( $l = 5$ , capacity = 12)
- **Magic 126:** Highest- $j$  is  $1i_{13/2}$  ( $l = 6$ , capacity = 14)
- **Magic 184:** Predicted highest- $j$  is  $1j_{15/2}$  ( $l = 7$ , capacity = 16)

The sequence  $l = 3, 4, 5, 6, 7$  shows consistent increments, with capacities following  $c = 2l + 2$ .

## 2 Mathematical Derivations

### 2.1 Origin of the $\Delta n$ Formula

The formula  $\Delta n = \frac{c_{start} \times (c_{start} + 2)}{4}$  encodes the sum of an arithmetic sequence.

Starting at  $c_{start}$  and decreasing by 2 until reaching 2:

$$\sum_{i=1}^n (c_{start} - 2(i - 1)) = c_{start} + (c_{start} - 2) + (c_{start} - 4) + \dots + 4 + 2 \quad (1)$$

This is an arithmetic series with:

- First term:  $a_1 = c_{start}$
- Last term:  $a_n = 2$
- Common difference:  $d = -2$
- Number of terms:  $n = \frac{c_{start}}{2}$

The sum is:

$$S = \frac{n(a_1 + a_n)}{2} = \frac{(c_{start}/2)(c_{start} + 2)}{2} = \frac{c_{start}(c_{start} + 2)}{4} \quad (2)$$

This demonstrates that  $\Delta n$  represents the total capacity of a decreasing sequence of orbitals.

## 2.2 Mathematical Origin of the ”+4” Increment

For high- $j$  orbitals where  $j = l + \frac{1}{2}$ :

$$c = 2j + 1 = 2(l + \frac{1}{2}) + 1 = 2l + 2 \quad (3)$$

When  $l$  increases by  $\Delta l = 2$  (progressing through odd integers):

$$c' = 2(l + \Delta l) + 2 \quad (4)$$

$$= 2l + 2\Delta l + 2 \quad (5)$$

$$= (2l + 2) + 2\Delta l \quad (6)$$

$$= c + 2\Delta l \quad (7)$$

Therefore:

$$\boxed{\Delta c = 2\Delta l = 2(2) = 4} \quad (8)$$

This explains why the phenomenological increment  $c_{high-j} = c_{start} + 4$  emerges naturally from the quantum mechanical structure.

## 2.3 Demonstrative Table

Table 2: Capacity progression for odd  $l$  values

$l$	Orbital	$j$	$c = 2l + 2$	$\Delta c$
1	p	3/2	4	–
3	f	7/2	8	+4
5	h	11/2	12	+4
7	j	15/2	16	+4
9	l	19/2	20	+4

Table 3: Comprehensive  $\Delta n$  correlation with experimental stability

Nucleus	N or Z	$c_{start}$	$\Delta n$	BE/A (MeV)
${}^4\text{He}$	2	2	2	7.074
${}^8\text{Be}$	4	4	6	6.476
${}^{12}\text{C}$	6	4	6	7.680
${}^{16}\text{O}$	8	4	6	7.976
${}^{20}\text{Ne}$	10	6	12	8.032
${}^{28}\text{Si}$	14	6	12	8.448
${}^{40}\text{Ca}$	20	2	2	8.551
${}^{56}\text{Ni}$	28	6	12	8.643
${}^{100}\text{Sn}$	50	8	20	8.667
${}^{208}\text{Pb}$	82	10	30	7.867

### 3 Extended Stability Analysis

#### 3.1 Complete Experimental Data

#### 3.2 Hierarchical Classification

Stability levels based on  $\Delta n$  values:

- $\Delta n = 2$ : Local stability (simple closures:  ${}^4\text{He}$ ,  ${}^{40}\text{Ca}$ )
- $\Delta n = 6$ : Subshell stability ( ${}^{12}\text{C}$ ,  ${}^{16}\text{O}$ )
- $\Delta n = 12$ : Regional stability ( ${}^{20}\text{Ne}$ ,  ${}^{28}\text{Si}$ ,  ${}^{56}\text{Ni}$ )
- $\Delta n = 20$ : Strong closure ( ${}^{100}\text{Sn}$ )
- $\Delta n = 30$ : Major magic number ( ${}^{208}\text{Pb}$ )
- $\Delta n = 42$ : Complete shell (predicted for 184)

### 4 Additional Graphical Analysis

## 5 The Hidden Sequence in Orbital Quantum Numbers

#### 5.1 Maximum $l$ Values Between Magic Numbers

Table 4: Maximum orbital angular momentum sequence

Magic Number	Maximum $l$ values	Pattern
50	1, 3, 4 (p, f, g)	Increasing
82	1, 2, 4, 5 (p, d, g, h)	Increasing
126	1, 3, 5, 6 (p, f, h, i)	Odd-dominated

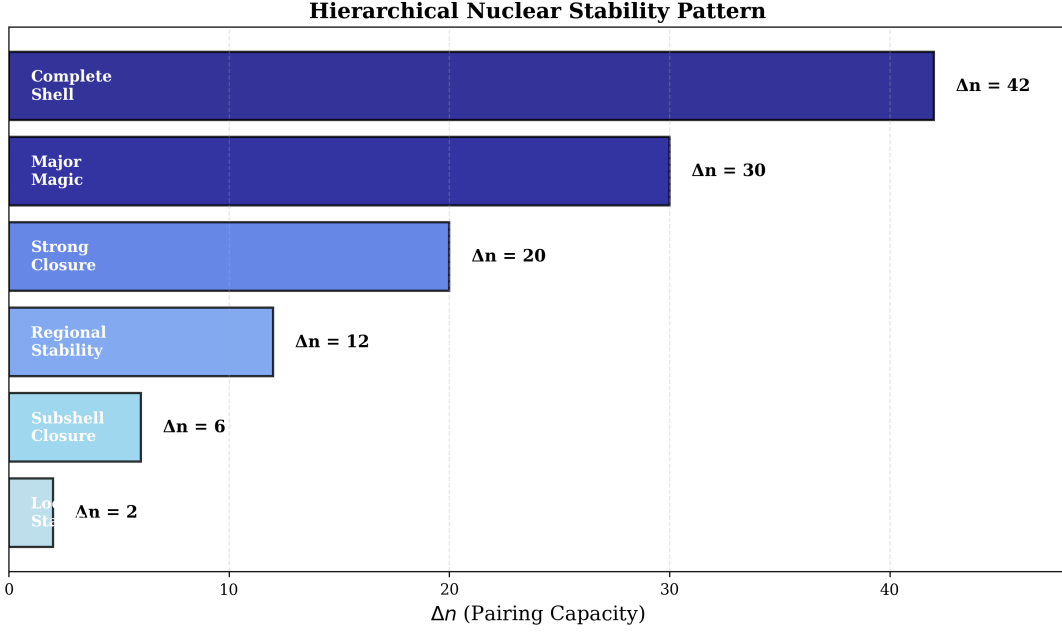

Figure 1: Hierarchical stability pattern showing six distinct levels of  $\Delta n$  values, from local stability ( $\Delta n = 2$ ) to complete shell closure ( $\Delta n = 42$ ).

Between major magic numbers above 28, orbitals with **odd  $l$  values** (1, 3, 5, 7, 9...) dominate due to strong spin-orbit coupling favoring high- $j$  states. This is not coincidental—it reflects fundamental nuclear structure.

## 5.2 Physical Interpretation

The ”+4” increment captures this pattern because:

1. Dominant orbitals have odd  $l$  (p, f, h, j...)
2. Moving from one major shell to next involves  $\Delta l \approx +2$
3. Through  $c = 2l + 2$ , this translates to  $\Delta c = 4$
4. The formula implicitly encodes quantum mechanics without requiring explicit quantum calculations

## 6 Increment Pattern After Doubly Magic N=Z Nuclei

**Observation:** The +4 increment appears systematically in the heavy nucleus regime, reflecting the dominance of high- $j$ , odd- $l$  orbitals characteristic of strong spin-orbit coupling.

Figure 2: Evolution of the phenomenological pattern from  $N/Z = 2$  to predicted magic number 184, showing progression through different stability regions.

Transition	$N=Z?$	Doubly Magic?	Increment	Observation
$2 \rightarrow 8$	Yes	Yes ( $^4\text{He}$ )	+2	Standard
$8 \rightarrow 20$	Yes	Yes ( $^{16}\text{O}$ )	+2	Standard
$20 \rightarrow 28$	No	No	+4	After $N=Z$
$28 \rightarrow 50$	Yes	Yes ( $^{56}\text{Ni}$ )	+4	After $N=Z$
$50 \rightarrow 82$	No	No	+4	Continuing
$82 \rightarrow 126$	No	No	+4	Standard
$126 \rightarrow 184$	No	No	+4	Predicted

## 7 Structural Complexity

### 7.1 Number of Contributing Orbitals

Magic numbers can be classified by the number of orbital structures contributing to the shell:

- **Simple closures** (2, 28): 1 dominant orbital structure
- **Intermediate closures** (8, 20): 3 orbital structures
- **Complex closures** (50, 82, 126): 4-6 orbital structures

**Correlation with  $\Delta n$ :**

- Small  $\Delta n$  (2): Simple structure
- Medium  $\Delta n$  (6, 12): 3-4 orbitals

- Large  $\Delta n$  (20, 30, 42): 5-6 orbitals

This suggests that larger  $\Delta n$  reflects not just greater capacity, but more intricate orbital filling patterns distributing nucleons across multiple subshells.

## 8 Phenomenological vs. Rigorous Approaches

### 8.1 Comparison with Shell Model

Table 6: Comparison of approaches

Aspect	This Work	Full Shell Model
Complexity	Arithmetic	Quantum mechanical
Computation	Seconds	Hours-Days
Parameters	2 per step	$\sim 100$ s
Predictive	Yes (184)	Yes (detailed)
Level ordering	No	Yes
Deformation	No	Yes
Pedagogical	Excellent	Difficult
Physical insight	$c = 2l + 2$	Complete

### 8.2 When to Use Each Approach

**Phenomenological formula:**

- Teaching nuclear structure basics
- Quick magic number estimates
- Understanding stability hierarchies
- Identifying patterns

**Full shell model:**

- Precise energy predictions
- Excited state calculations
- Deformed nuclei
- Fine structure details

## 9 VSEPR Analogy Extended

### 9.1 Parallel Concepts

Both approaches sacrifice rigor for accessibility while maintaining genuine physical content.

Table 7: VSEPR vs. Nuclear Pattern

Concept	VSEPR (Chemistry)	This Work (Nuclear)
Basic unit	Electron pairs	Nucleon pairs
Counting rule	Steric number	$\Delta n$
Predicts	Geometry	Magic numbers
Physical basis	Electron repulsion	Shell closure
Complexity	Arithmetic	Arithmetic
Accuracy	Good	Good
Limitations	Complex molecules	Deformed nuclei
Pedagogy	Excellent	Excellent

## 10 Future Directions

### 10.1 Testable Predictions

1. **184 as magic number:** Most immediate test
2.  **$\Delta n$  correlation:** Extend to more nuclei
3. **Neutron-rich systems:** Test pattern away from stability
4. **Superheavy elements:** Apply to  $Z=120+$  region

### 10.2 Possible Extensions

- Correlation with neutron separation energies
- Connection to deformation parameters
- Application to neutron vs. proton magic numbers
- Extension to semi-magic nuclei ( $N \neq Z$ )
- Development of interactive educational software

## 11 Complete Data Tables

All experimental binding energies taken from:

- AME2020: Atomic Mass Evaluation 2020
- ENSDF: Evaluated Nuclear Structure Data File

### 11.1 Calculation Verification

Each magic number prediction can be verified:

**Example: 50 to 82**

$$c_{start} = 8 \tag{9}$$

$$c_{high-j} = 12 \tag{10}$$

$$\Delta n = \frac{8 \times 10}{4} = 20 \tag{11}$$

$$C_{total} = 20 + 12 = 32 \tag{12}$$

$$M_{n+1} = 50 + 32 = 82 \quad \checkmark \tag{13}$$

All transitions in the main paper have been verified similarly.

## 12 Conclusion

This supplementary material provides comprehensive documentation of:

- Complete orbital structures
- Mathematical derivations
- Extended experimental correlations
- Detailed quantum mechanical connections
- Comparative analysis with rigorous methods

The phenomenological formula presented in the main paper represents a pedagogically valuable tool that, while approximate, captures essential nuclear structure patterns through the fundamental relationship  $c = 2l + 2$ .
